

Hiding default titles on dashboard

Normally when you filter out all the data on the dashboard, the titles will still appear by default as show in the below figure. Especially in dashboards when you want to guide the user not to see titles until user takes an action.

Steps to be followed :

1. Write a calculated field for the title.

Title - Profit by Segment

`MIN("Profit by Segment")`

2. Used the aggregation of MIN here to force it to be an aggregation to avoid it interfering with table calculations.
3. Drag the resulting calculated field on Columns to give you a custom "title" at the top of the view.
4. On the dashboard, you can hide the real title so that everything disappears when there is no data

Now to get a flexible title, we will use a column header with formatting. To get it,

1. Right-click the column header and select Format.
2. Change the font size.
3. Switch to Borders on the format window and adjust the level of Column Headers.
